ACIDA-UG: Advanced Agri-climate Information and Advisory System for Uganda

Expected Outputs	**Key Activities**
1. Agri-climate digital database developed	Collect, clean, integrate, and validate weather, climate, soil, and agricultural data.
2. Farm-specific Agri-Climate Advisory Tool developed	Design and develop the digital platform to provide localized weather forecasts and climate-smart farming recommendations.
3. Drought Monitoring and Early Warning (DMEW) system developed	Develop drought indicators, monitor rainfall and dry spells, and generate early-warning alerts for farmers.
4. Prototype tested and validated	Pilot the system on selected farms, assess performance, collect user feedback, and improve the prototype.
5. Farmers and stakeholders trained	Train farmers and agricultural extension workers on using the system and applying agri-climate advisories.
6. Project results disseminated	Prepare technical reports, document lessons learned, demonstrate the system, and share findings with relevant stakeholders.
